LINEAR ALGEBRA

Q1 Find the rank of the matrix $A = \begin{bmatrix} 4 & 2 & 1 & 3 \\ 6 & 3 & 4 & 7 \\ 2 & 1 & 0 & 1 \end{bmatrix}$

2

Q2 Find the rank of the matrix $A = \begin{bmatrix} -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 4 \end{bmatrix}$

3

Q3

1

Find the rank of the matrix $A = \begin{bmatrix} 1 & 1 & 1 \\ a & a & a \\ a^3 & a^3 & a^3 \end{bmatrix}$

Q4 Let $M = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 1 & 2 \\ 2 & 2 & 0 \\ -1 & 0 & 1 \end{bmatrix}$ .Then, the rank of M is-

(A) 3 (B) 4

(C) 2 (D) 1

Q5 If P and Q are non- singular matrices, then for matrix M, which of the following is correct?

~~(A) Rank (PMQ) > Rank M~~

~~(B) Rank (PMQ) = Rank M~~

(C) Rank (PMQ) < Rank M

~~(D) Rank (PMQ) = Rank M + Rank (PQ)~~

Q6 Rank of singular matrix of order 4 can be at most

(A) 1 (B) 2

(C) 3 (D) 4

Q7 The rank of (m × n) matrix (where m< n) cannot be more than

(A) m (B) n

(C) mn (D) Non

Q8 If for a matrix, rank equals both the number of row and number of columns, then the matrix is called.

(A) Non- singular (B) singular

(C) transpose (D) minor

Q9 Determine whether each of the following sets of vectors is a linearly independent subset of V.

V = R^2, {(1, 0,) , (−1, −1)}

V = R^2, {(1, −1,)} , (1, 1), (2, 1)}

V = R^3, {(1,1,0,)} , (−1, 1,1)}

V = R^3, {(1,0,0,)} , (1, 1,0), (1, 1 , 1)}

V =R^3, {(1,0,0,)} , (1, 1,0), (1, 1 , 1)}

Q10 A set of r, n dimensional vector x_1, x_2, x_3 ...... xr is said to be linearly independenly, if every relation of the type

$k_1x_1 + k_2x_2 + k_3x_3 + \ldots\ldots\ldots + k_rx_r = 0$ implies.

(A) $k_1 + k_2 + k_3 + \ldots\ldots\ldots\ldots + k_r = 0$

(B) $k_1 = k_2 = k_3 = \ldots\ldots\ldots\ldots = 0$

(C) $k_1 + k_2 + k_3 + \ldots\ldots\ldots\ldots + k_r = 0$

(D) None

Q11 If A is matrix of order n × m such that A in singular then column vectors are

(A) LD (B) LI

(C) orthogonal (D) orthonormal

Q12 If there exist no relationship between the column vectors of $A_{m \times n}$ then

(A) ρ(a) < n

(B) ρ(a) = n

(C) ρ(a) < m

(D) ρ(a) ≤ n

Q13 Find λ for which there exits a linear relationship between the vecotr $\hat{i} + 2\hat{j} + 3\hat{k}$;

GATE

$4\hat{i}+5\hat{j}+6\hat{k}, \lambda\hat{i}+8\hat{j}+9\hat{k}.$

(A) λ = 3

(B) λ = 7

(C) λ ± 7

(D) λ = 0

Q14 (a) Show that (2, 1, 1) and (1, -4 , 2) are orthogonal.

(b) Determine which of the following vectors are orthogonal :

$\mathbf{v_1 = (-2, 6, 1), v_2 = (9, 2, 6), v_3 = (4, -15, -1)}.$

v1v2 v2v3

Q15 Among the following, the pair of the vector orthogonal to each other is

(A) [3, 4, 7] , [3, 4, 7]

(B) [0, 0, 0], [1, 1, 0]

(C) [1, 0, 2], [0, 5, 0]

(D) [1, 1, 1] , [–, –1, 1]

Q16 If $\bar{a}=3\hat{i}-2\hat{j}+\hat{k}$ and $\bar{b}=4\hat{i}+3\hat{j}-\lambda\hat{k}$ are orthogonal then λ = ?

(A) 6 (B) 12

(C) –6 (D) –12

Q17 The vector which is orthogonal is every column vector of A = $\begin{bmatrix}1&1&0\\1&-1&0\\1&0&1\\1&0&-1\end{bmatrix}$ will be ?

(A) $\begin{bmatrix}1\\-1\\0\\1\end{bmatrix}$

(B) $\begin{bmatrix}1\\0\\-1\\0\end{bmatrix}$

(C) $\begin{bmatrix}-1\\-1\\1\\1\end{bmatrix}$

(D) $\begin{bmatrix}0\\0\\0\\0\end{bmatrix}$

Q18 Norm of vector $[8\ \ 4\ \ 1]^T$ is given as 9 _______?

Q19 The normalized vector of $\begin{bmatrix}2\\1\\-4\end{bmatrix}$ will be ?

Q20 For what values of α and β, the following simultaneous equations have an infinite number of solution?

x + y + z = 5

x + 3y + 3z = 9

x + 2y + az = β

$\alpha = 2$

$\beta = 7$

Q21 The following system of equations

$x_1 + x_2 + 2x_3 = 1$

$x_1 + 2x_2 + 3x_3 = 2$

$x_1 + 4x_2 + ax_3 = 4$

has a unique solution. The only possible value of a is/are

(A) 0

(B) either 0 or 1

(C) one of 0, 1 and –1

(D) and real number other than 5

Q22 The solution(s) to the equations

2x + 3y = 1, x – y = 4 , 4x – y = α , will exists if a is equal to

(A) –33 (B) 0

(C) 9 (D) $\frac{59}{5}$

Q23 For the following set of simultaneous equations:

1.5x – 0.5y = 2

4x + 2y + 3z = 9

7x + y + 5z = 10

(A) The solutions is unique

(B) Infinite many solution exists

(C) The equations are incompatible

(D) Finite number of multiple solution exist.

Q24 The conditon for consistency of simultaneous equation AX = B where $C = A : B$

(A) Rank A = Rank C
(B) Rank A ≠ Rank C
(C) Rank A = Rank B
(D) None of these

Q25 In the system of equation AX = B and A, B = C

(a) If the rank of A is not equal to rank of C
(p) consistant with unique solution
(b) If the rank of A is not equal to rank of C
(q) Infinite solutions consistant with
(c) If the rank A = rank of C < No. of unknowns
(r) have a solution
(d) The solution of AX = 0 is always
(s) inconsistant

(A) a->s,b->p,c->q,d->r
(B) a->s,b->p,c->q,d->p
(C) a->s,b->p,c->q,d->q
(D) a->s,b->p,c->q,d->q

?

Q26 The values of k for which equations x + y + z = 1, x + 2y + 4z = k, x+ 4y + 10z = k^2 have a solution

(A) 1 or 2
(B) 3 or 4
(C) 5 or 6
(D) any values

Q27 For what value of b the following system of equations has hon- trivial solution?

2x +y + 2z = 0
x +y + 3z = 0
4x + 3y + bz = 0

b = 16

Q28 Let AX = B be a system of linear equations where A is an m × n matrix and B is an n × 1 column matrix which of the following is false?

(A) The system has a solution, it ρA) = r(A/B)
(B) If m = n and B is non-zero vector then the system has a unique solution
(C) If m< n and B is a zero vector then the system has infinitely many solutions
(D) The system will have a trivial solution when m = n, B is the zero vector and rank of A is n.

Q29 Let A be a square matrix of order n, then nullity of A is

(A) n – rank A
(B) rank A – n
(C) n + rank A
(D) None of these

Q30 An n × n homogenous system of equations AX = 0 is given. The rank of A is r < n. Then the system has

(A) n – r independent solutions
(B) r independent solutions
(C) no solution
(D) n – 2r independent solutions

Q31 The symultaneous equation

$a_1x + b_2y + c_1 = 0$
$a_2x + b_2y + c_2 = 0$

$(i)\ \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$ $\qquad (p)$ $no\ solution$

$(ii)\ \frac{a_1}{a_2} \neq \frac{b_1}{b_2} = \frac{c_1}{c_2}$ $\qquad (q)$ $unique\ solution$

$(iii)\ \frac{a_1}{a_2} = \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$

$(r)\ infinitely\ many\ solutions$

$(iv)\ \frac{a_1}{a_2} \not\approx \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$ $\qquad (s)\ None\ of\ these$

(A) a->r
b->q
c->p
d->q
(B) a->p
b->s
c->q
d->r
(C) a->s
b->p
c->r
d->q
(D) None of these

Q32 If x + 2y – 2u = 0, 2x – y – u = 0, x = 2z – u = 0, 4x – y + 3z – u = 0 is a system of equations, then it is

(A) consistant with trivial solution
(B) consistant without trivial solution
(C) inconsistant with trivial solution
(D) inconsistant without trivial solution

GATE

Q33 The equations $kx + y + z = 0$, $-x + ky + z = 0$, $-x - y + kz = 0$ will have non-zero soluton, when real k is

(A) 3 (B) zero

(C) 1 (D) $\sqrt{3}$

Q34 For the given set of equations:

$x + y = 1$

$y + z = 1$

$x + z = 1,$

Which one of the following statements is correct?

(A) Equations are inconsistent

(B) Equations are consistent and a single non-trivial solution exists

(C) Equations are consistent and many solutions

(D) Equations are consistent and only a trivial solution exists

Hints & Solutions

Q1 Text Solution:

We have, $A = \begin{bmatrix} 4 & 2 & 1 & 3 \\ 6 & 3 & 4 & 7 \\ 2 & 1 & 0 & 1 \end{bmatrix}$

Performing $R_1 \to R_1 \div 4$

$$A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 6 & 3 & 4 & 7 \\ 2 & 1 & 0 & 1 \end{bmatrix}$$

Performing $R_2 \to R_2 - 6R_1$, $R3 \to R_3 - 2R_1$

and $A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 0 & 0 & 5/2 & 5/2 \\ 0 & 0 & -1/2 & -1/2 \end{bmatrix}$

Now, performing $R_2 \to R_2 \times \left(\frac{2}{5}\right)$, We get

$$A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & -1/2 & -1/2 \end{bmatrix}$$

Performing $R_3 \to R_3 + \frac{1}{2}R_2$, we get

$$A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Hence, number of non-zero rows = 2.

So, rank of given matrix = 2

Q2 Text Solution:

$$A = \begin{bmatrix} -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 4 \end{bmatrix}$$

$Reaaranging\ the\ rows\ we\ get -$

$$A = \begin{bmatrix} -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 4 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$So\ the\ number\ of\ non-zero\ rows\ is\ 3$

Q3 Text Solution:

$$A = \begin{bmatrix} 1 & 1 & 1 \\ a & a & a \\ a^3 & a^3 & a^3 \end{bmatrix}$$

$multiplying\ R1\ with\ a\ and\ subtracting$
$with\ R2\ and\ then\ multiplying\ R1\ with\ a^3$
$and\ subtracting\ with\ R3\ we\ get -$

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$Thus\ the\ rank\ is\ 1$

Q4 Text Solution:

We need to find the rank of the matrix,

$$M = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 1 & 2 \\ 2 & 2 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

Reduce the matrix to echelon form using the operations

"$R_2 \to R_2 + R_1$", $R_3 \to R_3 - 2R_1$ and $R_4 \to R_4 + R_1$.

Thus we get-

$$M = \begin{bmatrix} 1 & 1 & 0 \\ 0 & 2 & 2 \\ 0 & 0 & 0 \\ 0 & 1 & 1 \end{bmatrix}$$

GATE

and also applying $R_4 \to 2R_4 - R_2$, we have-

$$M = \begin{bmatrix} 1 & 1 & 0 \\ 0 & 2 & 2 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

So, rank of M = 2.

Q5 Text Solution:

Rank (PMQ) = Rank M, as P and Q are non singular matrices.

Q6 Text Solution:

So basically, the matrix is of order 4*4. Now as it is a asingular matrix so the rank can never be 4, but if we have to explain for at most number which can be the rank, it will be 3 only.

Q7 Text Solution:

A is any matrix of order m×n then rank or A$\leq$ min {m, n}

rank of A$\leq$ m

$\therefore$ rank of A $\leq$m $\qquad (\because \ m < n)$

Q8 Text Solution:

Given that both rows and columns are equal.

So let us consider $A_{n\times n}$

Also given that ρ(A) = number of rows of A = number of column of A.

So, ρ(A) = n

$\Rightarrow$ |A| $\neq$0

Q9 Text Solution:

The vectors are linearly independent if they cannot be expressed as the linear combination of each others.Thus after making linear combinations and having the system of solutions we have a trivial solution then the vectors will be independent of each other.

Q10 Text Solution:

The vectors are linearly independent if they cannot be expressed as the linear combination of each others.Thus after making linear combinations and having the system of solutions we have a trivial solution then the vectors will be independent of each other.

Q11 Text Solution:

If A is matrix of order n × m such that A in singular then column vectors are linearly dependent.

As the matrix is singular thus the determinant will be 0, hence the columns are LD.

Q12 Text Solution:

If there exist no relationship between the column vectors of $A_{m\times n}$ then they all are independent of each other thus the rank will be n.

Q13 Text Solution:

So we have 3 vectors as -

$\hat{i} + 2\hat{j} + 3\widehat{k}, 4\hat{i} + 5\hat{j} + 6\widehat{k}, \lambda\hat{i} + 8\hat{j} + 9\widehat{k}$

We have to express them as linear combination thus-

$$\alpha\left(\hat{i} + 2\hat{j} + \widehat{3j}\right) + \beta\left(4\hat{i} + 5\hat{j} + 6\widehat{k}\right)$$

$$= \lambda\hat{i} + 8\hat{j} + 9\widehat{k}$$

$$\alpha + 4\beta = \lambda - - - - \left(1\right)$$

$$2\alpha + 5\beta = 8 - - - - \left(2\right)$$

$$3\alpha + 6\beta = 9 - - - - - \left(3\right)$$

solving 3 *and* 4 *we get* $-$

$\alpha = -1, \beta = 2$

thus putting it in eqn 1 *we get*

$\lambda = \ -1 + 8 = 7$

Q14 Text Solution:

a) The two vectors are said to be orthogonal if the dot product of two vectors are 0.

Considering the first vector and multiplying the consecutive elements we get-

2*1-4*1+2*1=0

Thus they are orthogonal.

b) Similarly moving to the next question we get-

$v_1 . v_2 = -2 * 9 + 6 * 2 + 6 * 1 = 0,\ thus\ orthogonal$

$v_2 . v_3 = 9 * 4 - 15 * 2 - 1 * 6 = 0, thus\ orthogonal$

Q15 Text Solution:

The two vectors X_1 & X_2 are said to be orthogonal if $X_1 \cdot X_2 = 0$

Let $X_1 = [1\ 0\ 2]^T$ and $X_2 = [0\ 5\ 0]^T$

So, $X_1 \cdot X_2 = \begin{bmatrix}1\\0\\2\end{bmatrix} \cdot \begin{bmatrix}0\\5\\0\end{bmatrix} = 1 \times 0 + 0 \times 5 + 2 \times 0 = 0$

Method II:

For orthogonal vector: $\vec{a} \cdot \vec{b} = 0$

$i.e.$ if $\vec{a} = x_1 i + y_1 j + z_1 k$

& $\vec{b} = x_2 i + y_2 j + z_2 k$

Then: $x_1 x_2 + y_1 y_2 + z_1 z_2 = 0$

Option 'c' satisfies the condtion.

Q16 Text Solution:

$\bar{a} = 3\hat{i} - 2\hat{j} + \hat{k}, \bar{b} = 4\hat{i} + 3\hat{j} - \lambda\hat{k}$

Here as they are orthogonal thus, the dot product will be 0.

$\bar{a}.\bar{b} = 12 - 6 - \lambda = 0$

$\lambda = 6$

Q17 Text Solution:

$$A = \begin{bmatrix} 1 & 1 & 0 \\ 1 & -1 & 0 \\ 1 & 0 & 1 \\ 1 & 0 & -1 \end{bmatrix}$$

So we have the column vectors as $-$

$(1,1,1,1)^T, (1,-1,0,0)^T, (0,0,1,-1)^T$

$$Lets\ take\ the\ option\ \begin{pmatrix} c \end{pmatrix}$$

$If\ they\ are\ orthogonl\ ;\ then\ the\ dot\ product\ will\ turn\ out\ to\ be\ 0.$

$$\begin{pmatrix} -1,-1,1,1 \end{pmatrix} . \begin{pmatrix} 1,1,1,1 \end{pmatrix} = 0$$

$$\begin{pmatrix} -1,-1,1,1 \end{pmatrix} . \begin{pmatrix} 1,-1,0,0 \end{pmatrix} = 0$$

$$\begin{pmatrix} -1,-1,1,1 \end{pmatrix} . \begin{pmatrix} 0,0,1,-1 \end{pmatrix} = 0$$

$$Lets\ take\ the\ option\ \begin{pmatrix} d \end{pmatrix}$$

$$\begin{pmatrix} 0,0,0,0 \end{pmatrix} . \begin{pmatrix} 1,1,1,1 \end{pmatrix} = 0$$

$$\begin{pmatrix} 0,0,0,0 \end{pmatrix} . \begin{pmatrix} 1,-1,0,0 \end{pmatrix} = 0$$

$$\begin{pmatrix} 0,0,0,0 \end{pmatrix} . \begin{pmatrix} 0,0,1,-1 \end{pmatrix} = 0$$

Q18 Text Solution:

$Norm\ is\ defined\ as\ -$

$lets\ say\ we\ have\ a\ vector\ \ x_1\hat{i}+y_1\hat{i}+z_1\hat{i}$

$then\ norm\ is\ -\sqrt{x_1{}^2+y_1{}^2+z_1{}^2}$

$Thus\ here -$

$\sqrt{64+16+1}=\sqrt{81}=9$

Q19 Text Solution:

$The\ vector\ given\ is\ \begin{bmatrix}2\\1\\-4\end{bmatrix}$

$Norm\ is\ defined\ as\ -$

$lets\ say\ we\ have\ a\ vector\ \ x_1\hat{i}+y_1\hat{i}+z_1\hat{i}$

$then\ norm\ is\ -\sqrt{x_1{}^2+y_1{}^2+z_1{}^2}$

$Thus\ here -$

$\sqrt{4+1+16}=\sqrt{21}$

$Thus\ the\ normalised\ vector\ will\ be\ -$

$$\frac{1}{\sqrt{21}}\begin{bmatrix}2\\1\\-4\end{bmatrix}$$

Q20 Text Solution:

Putting the system of simultaneous equations in the form

AX = B

We get,

$$A=\begin{bmatrix}1&1&1\\1&3&3\\1&2&\alpha\end{bmatrix},\mathrm{X}=\begin{bmatrix}x\\y\\z\end{bmatrix},\mathrm{B}=\begin{bmatrix}5\\9\\\beta\end{bmatrix}$$

So, the augmented matrix

$$\widetilde{\mathrm{A}}=[\mathrm{A}:\mathrm{B}]=\begin{bmatrix}1&1&1&:&5\\1&3&3&:&9\\1&2&\alpha&:&\beta\end{bmatrix}$$

Operating $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$,

$$\text{We get}\sim\begin{bmatrix}1&1&1&:&5\\0&2&2&:&4\\0&1&\alpha-1&:&\beta-5\end{bmatrix}$$

Operating $R_2 \to R_2 \div 2$, we get

$$\sim\begin{bmatrix}1&1&1&:&5\\0&1&1&:&2\\0&1&\alpha-1&:&\beta-5\end{bmatrix}$$

Operating $R_3 \to R_3 - R_2$, we get

$$\sim\begin{bmatrix}1&1&1&:&5\\0&1&1&:&2\\0&1&\alpha-2&:&\beta-7\end{bmatrix}$$

Now, for ininfinte solution the last row must be zero.

Therefore, $\alpha - 2 = 0$ implies $\alpha = 2$

$\beta - 7 = 0$ implies $\beta = 7$

Q21 Text Solution:

Putting the given linear equations in AX = B form

$$A=\begin{bmatrix}1&1&2\\1&2&3\\1&4&\alpha\end{bmatrix},X=\begin{bmatrix}x_1\\x_2\\x_3\end{bmatrix}\text{and B}=\begin{bmatrix}1\\2\\4\end{bmatrix}$$

Now, augmented matrix

$$[A:B]=\begin{bmatrix}1&1&2&:&1\\1&2&3&:&2\\1&4&\alpha&:&4\end{bmatrix}$$

Operation $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$$=\begin{bmatrix}1&1&2&:&1\\0&1&1&:&1\\0&3&\alpha-2&:&3\end{bmatrix}$$

Operating $R_3 \to R_3 - 3R_2$, we get

$$=\begin{bmatrix}1&1&2&:&1\\0&1&1&:&1\\0&0&\alpha-5&:&0\end{bmatrix}$$

If $a - 5 \neq 0 \Rightarrow a \neq 5$

Then, rank of [A] = rank of [A : B] =3

Hence, a can take any value expect 5

Q22 Text Solution:

2x + 3y = 1........(i)

x − y = 4............(ii)

4x − y = α.......(iii)

Form equation (i) and equation (ii)

$x=\frac{13}{5},y=\frac{-7}{5}$

The solution of equations exists

$\Rightarrow\alpha=4\left(\frac{13}{5}\right)-\left(-\frac{7}{5}\right)$

$\alpha=\frac{59}{5}$

Q23 Text Solution:

$$\left|A\right|=Determinant\ of$$

$$\begin{bmatrix}1.5&-0.5&0\\4&2&3\\7&1&5\end{bmatrix}$$

= (1.5) (10−3) + (0.5) (20−21)

GATE

$= 10.5 - 0.5 = 10 \neq 0$

Q24 Text Solution:

We have to find the conditon for consistency of simultaneous equation AX = B where C=A:B

That C is equal to A augmented B , no in order for the consistency of equations means that the solutions must exist either unique or infinite thus for this the rank of A must be equal to rank of C .

Q25 Text Solution:

(a) If the rank A rank of C

(r) have a solution

(c) If the rank A = rank of C < No. of unknowns

(p) consistant with unique solution

(c) If the rank A = rank of C < No. of unknowns

(q) Infinite solutions consistant with

(d) The solution of AX = 0 is always

(r) have a solution

The correct solutions is a->s,b->p,c->q,d->r

Q26 Text Solution:

The values of k for which equations x + y + z = 1, x + 2y + 4z = k, x+ 4y + 10z = k^2 have a solution

$$\left[\begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 1 & 2 & 4 & k \\ 1 & 4 & 10 & k^2 \end{array}\right]$$

$$R_2 -> R_2 - R_1$$
$$R_3 -> R_3 - R_1$$

$$\left[\begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & k-1 \\ 0 & 3 & 9 & k^2-1 \end{array}\right]$$

$$R_3 -> R_3 - 3R_2$$

$$\left[\begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & k-1 \\ 0 & 0 & 0 & k^2-1-3K+3 \end{array}\right]$$

$$K^2 - 3K + 2 = 0$$
$$K - 2 = 0, K - 1 = 0$$
$$K = 1, 2$$

Q27 Text Solution:

Sience the system of homogeneous equations has non-trivial solution

Hence, $|A| = 0$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 2 \\ 1 & 1 & 3 \\ 4 & 3 & b \end{vmatrix} = 0$$

$$\Rightarrow 2\begin{vmatrix} 1 & 3 \\ 3 & b \end{vmatrix} - 1\begin{vmatrix} 1 & 3 \\ 4 & b \end{vmatrix} + 2\begin{vmatrix} 1 & 1 \\ 4 & 3 \end{vmatrix} = 0$$

$\Rightarrow 2(b - 9) - 1(b-12) + 2(3 - 4) = 0$

$\Rightarrow b - 8 = 0$

$\Rightarrow b = 8$

Q28 Text Solution:

Given, that $A_{m*n} X_{n*1} = B_{m*1}$

According to option (b)

We can take m = n & B = 0

So (1) = $A_{m*n} X_{n*1} = O_{m*1}$

If |A| is not equal to 0, system have unique solution if |A|=0 system have infininte solution.

Hence, option (b) in wrong because condition of unique solution is not mentioned.

Q29 Text Solution:

Let A be a square matrix of order n, then nullity of A is

then the nullity is defined as n-r,

The nullity of a matrix is **the dimension of the null space of A, also called the kernel of A**.

Q30 Text Solution:

An n × n homogenous system of equations AX = 0 is given. The rank of A is r < n. Then the system has will have n-r independent solutions

Q31 Text Solution:

a) $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$ (r) Infinity many solutions

b) $\frac{a_1}{a_2} \neq \frac{b_1}{b_2} = \frac{c_1}{c_2}$ (q) unique solution

c) $\frac{a_1}{a_2} = \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$ (p) No solution

d) $\frac{a_1}{a_2} \not\approx \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$ (s) None of these

The correct solutions will be-

a->r

b->q

c->p

d->q

Q32 Text Solution:

$If\ x + 2y - 2u = 0,\ 2x - y - u = 0,\ x + 2z - u = 0,\ 4x - y + 3z - u = 0$

$Thus\ AX = O$

$$\begin{bmatrix} 1 & 2 & -2 & 0 \\ 2 & -1 & -1 & 0 \\ 1 & 0 & -1 & 2 \\ 4 & -1 & -1 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ u \\ z \end{bmatrix} = O$$

If u willl calculate the determinant of A its coming out to be non-zero,thus consistant with trivial solution.

Q33 Text Solution:

$The\ equations\ are\ kx + y + z = 0, -x + ky + z = 0, -x - y + kz = 0$

$$\left[\begin{bmatrix} k & 1 & 1 \\ -1 & k & 1 \\ -1 & -1 & k \end{bmatrix} \middle| \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]$$

$Thus\ the\ determinant\ should\ be\ equal\ to\ 0$

$$\begin{bmatrix} k & 1 & 1 \\ -1 & k & 1 \\ -1 & -1 & k \end{bmatrix} = A$$

$|A| = 0$

$$k\left(k^2 + 1\right) - 1\left(-k + 1\right) + 1\left(1 + k\right) = 0$$

$k^3 + k + k - 1 + 1 + k = 0$

$k^3 + 3k = 0$

$k = 0$

Q34 Text Solution:

$Lets\ make\ the\ augmented\ matrix\ for\ the\ system\ of\ equations -$

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

$$\left[\begin{matrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{matrix} \middle| \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

$As\ the\ determinant\ of\ A\ is\ not\ 0\ and\ thus\ the\ rank\ of\ A = 3\ thus\ the\ system\ of\ equations\ will\ have\ a\ unique\ solution.$
